

RIP (Routing Information Protocol)

- ❑ Distance vector algorithm
- ❑ Included in BSD-UNIX Distribution in 1982
- ❑ Distance metric: # of hops (max = 15 hops)

| <u>destination</u> | <u>hops</u> |
|--------------------|-------------|
| u | 1 |
| v | 2 |
| w | 2 |
| x | 3 |
| y | 3 |
| z | 2 |

RIP advertisements

- ❑ Distance vectors: exchanged among neighbors every 30 sec via Response Message (also called **advertisement**)
- ❑ Each advertisement: list of up to 25 destination nets within AS

RIP: Example

| Destination Network | Next Router | Num. of hops to dest. |
|---------------------|-------------|-----------------------|
| W | A | 2 |
| Y | B | 2 |
| Z | B | 7 |
| X | -- | 1 |
| | | |

Routing table in D

RIP: Example

| Dest | Next | hops |
|------|------|------|
| w | - | - |
| x | - | - |
| z | C | 4 |
| | ... | ... |

Advertisement
from A to D

| Destination Network | Next Router | Num. of hops to dest. |
|---------------------|----------------|-----------------------|
| w | A | 2 |
| y | B | 2 |
| z | B A | 7 5 |
| x | -- | 1 |
| | | |

Routing table in D

Network Layer

RIP: Link Failure and Recovery

If no advertisement heard after 180 sec -->
neighbor/link declared dead

- routes via neighbor invalidated
- new advertisements sent to neighbors
- neighbors in turn send out new advertisements (if tables changed)
- link failure info quickly propagates to entire net
- poison reverse used to prevent ping-pong loops (infinite distance = 16 hops)

RIP Table processing

- ❑ RIP routing tables managed by **application-level** process called route-d (daemon)
- ❑ advertisements sent in UDP packets, periodically repeated
